

Anti-Spam Bot

User Guide

For server members, moderators and admins

1. What is the Anti-Spam Bot?

The Anti-Spam Bot checks messages it can see on the server. It detects repeated text and simple spam patterns, reports suspected cases, and can delete messages or temporarily time out members. **It never kicks or bans members automatically.**

Important: A suspected case is not proof of a scam. The bot may delete a message or apply a timeout before a moderator reviews it. Only authorized moderators decide whether to kick or ban someone.

2. How does the bot detect spam?

Method 1 – Account age:

A Discord account less than **4 days** old is rated **High risk**. Account age alone does **not** send a mod alert or delete a message.

Method 2 – Repeated messages:

In this project's configuration, **3 identical messages within 15 minutes** trigger detection. Without a setting, the code default is 4.

Method 3 – Simple keyword patterns:

With `ML_SPAM_DETECTION=true`, the word filter detects **free**, **click**, **discord.gg** and **bit.ly**. Even **free-test-123** may trigger it. This is not a trained machine-learning model.

Risk overview:

Situation	Risk	Bot response in Active mode
New account, normal message	High	No action based on account age alone.
3 identical messages in 15 min.	Normal / High	Suspected case; delete if enabled and alert mods.
One keyword match	Normal / High	Suspected case; even this one message may be deleted.
Normal single message	Normal	No anti-spam action.

3. What happens when spam is detected?

Step 1 – Log and possibly delete

The bot logs a suspected case with a case ID. In **Active** mode with **SPAM_DELETE=true**, it attempts to delete the message. For repeated text, it also searches for matching messages from the previous 30 minutes.

Step 2 – Notify moderators

The private mod channel shows the account, risk level, message excerpt and case ID. Alerts for the same text are usually throttled for two minutes; the first time the repeat threshold is reached still triggers a new alert.

Step 3 – Moderation buttons

The alert has four buttons: **Timeout**, **Kick**, **Ban** and **Fehlalarm** (false alarm). The bot checks the clicker's Discord permissions. Sanctions also depend on role hierarchy.

Step 4 – Automatic timeout

Repeated spam from a member who has been on the server for at least **30 days** may lead to a 10-minute timeout. One keyword match by an older member is not enough. Another trigger within 15 minutes may increase the timeout to **2 hours**; mods get an extra alert.

Observe mode: The bot still detects, logs and reports suspected cases. It does not delete messages, time out members or request a DM code. Admins switch modes with **/antispammodus**.

4. DM code and exceptions

Code challenge: If **CAPTCHA_HIGH_RISK** is enabled, a suspicious new account receives a six-digit code by DM. It is valid for 10 minutes and allows 3 attempts; after three wrong entries, there is a 10-minute lockout. Further server messages are deleted while verification is pending. On success, the elevated age risk is suspended for 24 hours. The code confirms DM access, not that the sender is human.

Exceptions: Admins, moderators and trusted roles are **not automatically exempt**. Admins can exempt a user, role or channel for 1 to 720 hours using **/antispamausnahme**. The default duration is 24 hours.

5. Commands and buttons – overview

Command / action	Who?	What happens?
<code>/antispam</code>	Manage Server	Shows mode, settings and today's case count.
<code>/antispamstats</code>	Administrator	7-day chart, accounts, triggers and actions.
<code>/antispamfaelle</code>	Manage Server	Lists recent cases or details for a case ID.
<code>/antispamdiagnose</code>	Administrator	Checks mod channel and write access; optional test alert.
<code>/antispammodus</code>	Administrator	Switches between Active and Observe modes.
<code>/antispamausnahme</code>	Administrator	Adds, lists or removes temporary exceptions.

Mod button	Required permission	Effect
Timeout	Moderate Members	10-minute timeout.
Kick	Kick Members	Removes the account from the server.
Ban	Ban Members	Banned until manually unbanned.
Fehlalarm	Manage Messages	Marks a false alarm; does not undo prior actions.

6. Guide for moderators

- **Read the alert:** Who sent what, what is the risk, and which case ID belongs to it?
- **Check context:** A new account or a single keyword may be a false positive.
- **Choose an action:** Apply Timeout, Kick or Ban after review, or mark **Fehlalarm**.

After a click: A successful decision removes the mod alert. By default, a failed action leaves it visible. **Fehlalarm** does not restore deleted messages or end an existing timeout.

7. Frequently asked questions (FAQ)

I triggered the spam filter by accident. What now?

Contact the moderators and include the time, channel and message. A mod can mark the case **Fehlalarm**. Moderators must lift an existing timeout in Discord.

Why was my message deleted?

Possible reasons include repeated identical text, a keyword match or a pending DM code challenge. With keyword filtering enabled, even a single **free-test-123** may be deleted.

My account is new. Will I be reported for that?

No. Being under 4 days old only raises the risk rating. Without a spam pattern or repeated text, no mod alert is sent.

Can the bot ban me permanently on its own?

No. Automatic actions are limited to deletion and, under certain conditions, a timeout. Kicks and bans require a click from an authorized person.

What does the “Fehlalarm” button do?

It records a moderator's false-alarm decision and removes that alert. It is not a permanent allowlist and does not undo actions already taken.

Why did I receive a code by DM?

A suspicious new account may be asked to enter a six-digit code. If your DMs are closed, the code cannot be delivered. Contact the moderators if you need help.

Why can't I see the mod alert?

It belongs in a private mod channel. Admins can check access with **/antispamdiagnose** and send a harmless test alert with **testmeldung:true**.

For help, contact the server moderators or administrator.

8. Setup and statistics for admins

Set up the bot

Install Node.js and run **npm ci** in the project folder. Copy **.env.example** to your own **.env**. Enable **Server Members Intent** and **Message Content Intent** in the Discord Developer Portal. Presence Intent is not needed.

Permissions and startup

The bot needs access to the private mod channel, plus permissions to send/manage messages and moderate members. Kick and Ban need the matching extra permissions. Its role must be above the target roles. Run **node deploy-commands.js**, then start or restart with **npm start** or **run-bot.bat**. Register commands again after changing them.

Cases and statistics

/antispamfaelle lists up to ten recent cases or details for a case ID. **/antispamstats** shows seven days of case and distinct-account counts, up to ten accounts in the list, plus triggers and actions. These are suspected cases, not confirmed scammers. Alert throttling means case counts do not equal the number of deleted messages.

Key settings:

Variable	Effect / current project configuration
SPAM_DELETE	Automatic deletion; currently true .
ML_SPAM_DETECTION	Simple keyword filter; currently true .
CAPTCHA_HIGH_RISK	DM code for suspicious new accounts; currently true .
SIMILAR_MESSAGE_THRESHOLD	Currently 3 ; code default without a setting is 4.
NEW_ACCOUNT_AGE	Age threshold for higher risk; currently 4 days .
ALERT_COOLDOWN_MS	Throttle repeated alerts; default 120000 ms .
AUTO_TIMEOUT_MEMBER_AGE_MS	At least 30 days of server membership by default.
DELETE_MOD_MESSAGE_ON_FAILURE	Remove a failed action's alert only if true ; default false .

Data and security: **spam_logs.jsonl** stores cases, actions and up to 200 characters of suspicious text. **antispam-settings.json** stores the mode and exceptions. Keep the mod channel private. Rotate any bot token previously committed to Git before publishing publicly; it may still be in the repository history.
